1. In this exercise, you will make the Calculator applet that you wrote earlier in the semester actually do the right things when you push the buttons. This is the most involved project you have worked on this semester, so start early and think carefully about your design before you start actually writing the code.

2. Exercise 13 on page 270 in your text.

Be sure to include appropriate comments in your code and to test your applets completely before handing them in.

\textit{Start early (or now) and have fun!}
