

# CS2: A Twofold Approach

Benjamin Kuperman

Oberlin College

# About myself

- ✦ No prior background in CS2 education
- ✦ Taught CS2 at Swarthmore College 4 times
- ✦ Taught CS2 at Oberlin College 1.5 times

# Course goals

- ✦ Language independent understanding of data structures and their algorithms
- ✦ Implementation of data structures and an application using the structure
- ✦ Refinement of skills and techniques from CS1

# Idea behind 2-fold approach

- ✦ **Lectures** cover concepts and algorithms
  - ✦ Try to keep it language neutral
  - ✦ But use terminology consistent with lab
- ✦ **Labs** cover implementation via hands-on learning
  - ✦ Tie in language specifics

# Lecture style

- ✦ Almost no computer or code
  - ✦ ~6 times in the semester
- ✦ Learn Big-O early, use it often
  - ✦ Everything discussed in terms of Big-O
- ✦ Make them doubt themselves to become confident in themselves

# Exams

- **Short answer questions**

- Definitions, concepts, trade-offs, solution design, spot-check labs

- **Data structure questions**

- Ask for outlines of algorithms
- Demonstrate actions on data structures

# Laboratory assignments

- ✦ 2 primary components to each
  - ✦ Data structure
  - ✦ Application (problem?)
- ✦ Most allow pair programming
  - ✦ Usage alternates by semester
- ✦ Use large, real-world data set to make it worthwhile

# Data structures

- ✦ Implementations of Java collections classes
  - ✦ MyArrayList, MyHashMap, etc.
  - ✦ Identical method signatures and behavior
- ✦ Trying out partial implementations via abstract
  - ✦ Unclear which is better

# Other topics

- ✦ Eclipse IDE
- ✦ Pair programming
- ✦ Documentation
- ✦ Code reuse/maintainability
- ✦ Version control

# Group assignments

- ✦ Tradeoff: larger, 2-stage assignments
- ✦ Many worked on their own
  - ✦ Difficulty scheduling
  - ✦ Wanted to learn
- ✦ Setup SVN repository for pairs to share code
  - ✦ more useful than expected

# Assignments Spring 2008

- ✦ MyArrayList/Testing
- ✦ Algorithm Timing
- ✦ Maze Solver (stacks, queues, recursion)
- ✦ Email directory (linked lists)
- ✦ Binary Tree methods
- ✦ Word frequency tree
- ✦ Processing search queries (Binary heaps)
- ✦ Caching results, GUI (Hashtables)
- ✦ Boggle solver (Tries)
- ✦ Kevin Bacon Game (Graphs)

# Student Feedback

- ✦ Favorite: email database, Kevin Bacon game
- ✦ Common regrets:
  - ✦ “Wish I’d started earlier”
  - ✦ “Wish I had worked with a partner”
- ✦ Eclipse: “angry red line”, debugger, quick fix

# Hints on making this work

- ✦ Use consistent Java collections syntax
- ✦ Use a book with complete implementations and Java syntax
- ✦ Be prepared to spend time in the lab
  - ✦ Consider hiring weekend helpers

# Large, real-world datasets

- ✦ Motivates the use of efficient algorithms
  - ✦ Must be larger than they could do by hand
- ✦ Real-world data is more interesting
  - ✦ Database search for their friends instead of “A. Random Student” or “student 12”

# Data sources

- ✦ Student directory information
- ✦ Library/card catalog
- ✦ Project Gutenberg
- ✦ Wikipedia
- ✦ IMDB
- ✦ CIA World Fact Book
- ✦ US Census data
- ✦ FreeDB
- ✦ Celestia/Astro DB
- ✦ JDK
- ✦ Thinking in Java
- ✦ WWW/Web crawling
- ✦ Swivel.com

# Student directory information

- ✦ Ask for it from registrar(?)
- ✦ Often online, searchable database
  - ✦ Usually can generate URLs & download
- ✦ BlackBoard has passwd like users file
- ✦ Library often has searchable catalog

# Sun's JavaDoc

- ✦ Full copy of Java documentation in HTML
  - ✦ <http://java.sun.com/javase/downloads/index.jsp>
- ✦ Local mirror copy (284MB)
  - ✦ Do “file://” URL processing instead of http

# IMDB.com

The Internet Movie Database

WWW.IMDB.COM

- Full database available for download
  - <http://www.imdb.com/interfaces#plain>
- You want “actors.list.gz” & “actresses.list.gz”
- 193MB processed, 4,799,462 entries

# Wikipedia

- ✦ <http://en.wikipedia.org/wiki/WP:DD>
- ✦ ~8GB of raw data
  - ✦ HTML, XML, SQL
- ✦ perl parser for XML
- ✦ Static dump, meta info dump
